

# Find K Closest Elements

Try to solve the Find K Closest Elements problem.

## We'll cover the following ^

- Statement
- Examples
- Understand the problem
- Figure it out!
- Try it yourself

## Statement

You are given a sorted array of integers, `nums`, and two integers, `target` and `k`. Your task is to return `k` number of integers that are close to the target value, `target`. The integers in the output array should be in a sorted order.

An integer, `nums[i]`, is considered to be closer to `target`, as compared to `nums[j]` when  $|\text{nums}[i] - \text{target}| < |\text{nums}[j] - \text{target}|$ . However, when  $|\text{nums}[i] - \text{target}| = |\text{nums}[j] - \text{target}|$ , the smaller of the two values is selected.

### Constraints:

- $1 \leq k \leq \text{nums.length}$
- $1 \leq \text{nums.length} \leq 10^4$
- `nums` is sorted in ascending order.
- $-10^4 \leq \text{nums}[i], \text{target} \leq 10^4$

## Examples

### Sample example 1

#### Input

1	2	3	4	5
---	---	---	---	---

`k = 4, target = 3`

#### Output

1	2	3	4
---	---	---	---

Since  $k = 4$ , we need four integers that are close to the given target, i.e., 3.

# Understand the problem

Let's take a moment to make sure you've correctly understood the problem. The quiz below helps you check if you're solving the correct problem:

Find K Closest Elements

1

What are the `k` closest integers to `target` if the following data is given as input?  
  
`nums` = [1, 3, 5, 7, 9, 11]  
  
`k` = 4  
  
`target` = -7

A) [1, 3, 5]

B) [1, 3, 5, 7]

C) [1, 3, 5, 9]

D) [0, 1, 3, 5, 7, 9, 11]

# Figure it out!

We have a game for you to play. Rearrange the logical building blocks to develop a clearer understanding of how to solve this problem.

 Drag and drop the cards to rearrange them in the correct sequence.

Compute the distance between each element in the `nums` array and `target`.

Store the distances and their corresponding elements as pairs in a new array, `distances`.

?

Tt

🔄

Sort **distances** in ascending order based on the absolute differences, and if any two pairs have the same absolute difference, sort them based on the element value in ascending order.

Extract the first **k** elements from **distances** and store them in a new array, **result**.

Sort **result** in ascending order and return.

## Try it yourself

Implement your solution in **KClosest.java** in the following coding playground. We've provided a useful code template in the other file that you may build on to solve this problem.

Java

KClosest.java

```
1 import java.util.*;
2
3
4
5
6 // your code will replace this placeholder return statement
7 return new ArrayList<>();
8 }
9 }
```
